Seed Germination  
and Purity  
Analysis—2004

BY SHARON M. DOUGLAS  
AND MARY K. INMAN

*Bulletin 994  
May 2004*

## **SEED GERMINATION AND PURITY ANALYSIS 2004**

### **Sharon M. Douglas and Mary K. Inman**

Official samples of 350 vegetable, 15 lawn, and 4 crop seed were collected by inspectors from the Bureau of Regulation and Inspection of the Connecticut Department of Agriculture for testing in 2004. As the official seed testing laboratory, The Connecticut Agricultural Experiment Station performed germination and purity analyses for compliance with the Connecticut Seed Law Regulations and the Federal Seed Act.

Table 1 shows the results of germination tests for individual vegetable seed samples from 12 companies. Results are presented by plant type, variety, germination found, germination standard, and compliance with the standard. Germination standards are set by the Federal Seed Act. The categories for label compliance are: 1) seeds meet label claims for germination and 2) seeds do not meet label claims for germination within allowable tolerance. All tests were replicated twice. In addition, seedlings must also appear "normal", i.e., they have to be free from decay, have well-developed primary root systems, have well-developed and intact hypocotyls and/or epicotyls, and have healthy cotyledons. Of the 350 vegetable seed samples tested, four did not meet their label claims for germination but were not retested because of insufficient numbers of seeds. Seed samples were also examined for prohibited noxious weed seeds. No vegetable samples contained weed contaminants.

The total number of germination claims and the percentage of claims that met or failed label claims are summarized for each vegetable seed company in Table 2. Table 3 summarizes the total number of samples tested and the average germination for each type of vegetable.

Table 4 shows the results of purity and germination tests for individual lawn grass seed samples. These are presented by company, brand name and/or seed type or variety mixture. The categories for both purity and germination are as previously described for vegetable seeds. Lawn seed samples that were labeled with several varieties within a species or with several species within a genus were separated by genus. Purity and germination results are therefore reported as the sum for that genus. The label claim is met as long as this sum equals or exceeds the sum of the individual components for a genus listed on the label. Four of the 15 lawn seed samples tested met label claims for both purity and germination. Nine samples did not meet claims for purity but passed label claims for germination. One sample did not meet claims for germination but passed label claims for purity. One sample failed label claims for both purity and germination.

Table 5 shows the results of purity and germination tests for crop seed samples. One of the four samples met label claims for germination and purity. One sample failed label claims for both purity and germination and two samples did not meet label claims for purity but passed claims for germination. In addition to germination and purity tests, samples were also examined for prohibited noxious weeds. No noxious weeds were found in any of the samples.

Analyses were performed by Mary K. Inman and Dr. Sharon M. Douglas. Samples were collected by Alton A. Blodgett, Seed Control Official and John Schneider. The Seed Law is administered by the Seed Control Official for the Commissioner of the Department of Agriculture.

Sharon M. Douglas

Table 1. Germination of vegetable seeds. Standards are provided by the rules and regulations of the Federal Seed Act. \* = Does not meet label claim. H= Seeds remained hard at the end of the test period because they did not absorb water due to an impermeable seed coat.

Table 4. Germination and purity of lawn seed. Results for purity and germination are for seeds separated by genus and not by species or variety are reported for that genus. Tolerance (Tol) is calculated according to the rules for seed testing published by the Association of Official Seed Analysts (AOSA). Variance (Var) is calculated as Purity Found (Pur F) minus Purity Claimed (Pur C). Germination Claimed (Germ C); Germination Found (Germ F). \* = Does not meet label claim.

Seed Company	Seed Mixture	Pur C	Pur F	Var	Tol	Germ C	Germ F
Loft's Seed Co.	<i>Lofts All Perennial Landscape Mix</i>						
	85/80 Kentucky Bluegrass	13.70	16.84	3.14	1.87 *	80	84
	Palmer III Perennial Ryegrass	59.53	57.15	-2.38	4.19	90	93
